

## The Pumping Lemma

Some languages are not regular languages.  
The *pumping lemma* can be used to show this.  
It uses proof by contradiction and the pigeon-hole principle.

Application of pigeonhole principle:  
If a string is as long or longer than the number of states in a DFA,  
then some state is visited more than once.

---

Application of proof by contradiction:  
Assume  $L$  corresponds to some DFA  $M$ .  
Let  $m$  be the number of states in  $M$ .  
Create a long string  $w \in L$ .  
Show that if  $M$  accepts  $w$ ,  
then  $M$  must accept some string  $w' \notin L$ .  
This contradicts assumption that  $\mathcal{L}(M) = L$ .

## Proof of the Pumping Lemma

Theorem: Let  $L$  be a regular language. There exists a number  $m$ , for all  $w$ , if  $|w| \geq m$  and  $w \in L$ , then there exists  $x, y, z$  such that

$$w = xyz, \text{ and}$$

$$|xy| \leq m, \text{ and}$$

$$|y| \geq 1, \text{ and}$$

$$xy^*z \subseteq L, \text{ i.e., } xy^i z \in L \text{ for all } i \geq 0$$

---

Proof: Let  $M$  be a DFA such that  $L = \mathcal{L}(M)$ . Let  $m$  be the number of states in  $M$ .

Suppose  $|w| \geq m$  and  $w \in L$ .

Then a repetition of states in first  $m$  symbols.

Let  $w = xyz$ , where  $\delta^*(q_0, x) = \delta^*(q_0, xy)$

Clearly, any  $xy^i$  leads to the same state, from which  $z$  leads to the final state.

## Using the Pumping Lemma

$$L_1 = \{a^n b^n : n \geq 0\}$$

Suppose a DFA  $M_1$  accepts  $L_1$ .

Let  $m$  be the number of states in  $M_1$ .

Choose  $w = a^m b^m$ .

$M_1$  must repeat states reading  $a^m$ .

By the PL, if  $M_1$  accepts  $a^m b^m$ , then  $M_1$  accepts strings with more  $a$ 's without changing the number of  $b$ 's.

Contradicts assumption that  $M_1$  accepts  $L_1$ .

---

$$L_2 = \{a^l b^n : l \geq n\}$$

Suppose a DFA  $M_2$  accepts  $L_2$ .

Let  $m$  be the number of states in  $M_2$ .

Choose  $w = a^m b^m$ .

$M_2$  must repeat states reading  $a^m$ .

By the PL, if  $M_2$  accepts  $a^m b^m$ , then  $M_2$  accepts one string with fewer  $a$ 's without changing the number of  $b$ 's.

Contradicts assumption that  $M_2$  accepts  $L_2$ .

$$L_3 = \{ww^R : w \in \{a, b\}^*\}$$

Suppose a DFA  $M_3$  accepts  $L_3$ .

Let  $m$  be the number of states in  $M_3$ .

Choose  $w = a^m b b a^m$ .

$M_3$  must repeat states reading  $a^m$ .

By the PL, if  $M_3$  accepts  $a^m b b a^m$ , then  $M_3$  accepts strings with more  $a$ 's on the left without changing the number of  $a$ 's on the right.

Contradicts assumption that  $M_3$  accepts  $L_3$ .

$$L_4 = \{a^{2^k} : k \geq 0\}$$

Suppose a DFA  $M_4$  accepts  $L_4$ .

Let  $m$  be the number of states in  $M_4$ .

Choose  $w = a^{2^n}$ , where  $2^n > m$ .

$M_4$  must repeat states reading first  $m$   $a$ 's

By the PL, if  $M_4$  accepts  $a^{2^n}$ , then  $M_4$  accepts a string with 1 to  $m$  more  $a$ 's.

However  $2^n < 2^n + m < 2^{n+1}$ , i.e., the number of  $a$ 's won't be a power of 2.

Contradicts assumption that  $M_4$  accepts  $L_4$ .

$$L_5 = \{a^n : n \text{ is not a power of } 2\}$$

If  $L_5$  was regular,

then  $\overline{L_5} = L_4$  would be regular,

which is a contradiction.
